

Metrocar User Funnel Analysis

Executive Summary

Metrocar is a ride-sharing platform that allows users to download the application, register, request rides, complete trips, make payments, and leave reviews.

The purpose of this analysis is to identify where users drop off before completing their first ride and provide recommendations to improve conversion and customer experience.

The analysis was performed using SQL, Power BI, and Google Sheets.

1. Business Problem

Metrocar management observed that many users do not reach their first completed ride.

The objectives of this analysis are:

- identify the largest drop-off points in the funnel;
- analyze user behavior by age group and platform;
- evaluate the impact of time of day on ride completion;
- provide recommendations to improve conversion.

2. Data Overview

The dataset contains information about:

- application downloads;
- user registrations;
- ride requests;
- ride acceptance and completion;
- payments;
- customer reviews.

Technologies used:

- SQL
- PostgreSQL
- Power BI
- Google Sheets

3. User Funnel Analysis

Stage	Number	Conversion to next step	% Drop-off
downloaded	23608		
signups	17623	74.65%	25.35%
ride_requested	12406	70.40%	29.60%
ride_accepted	12278	98.97%	1.03%
ride_completed	6233	50.77%	49.23%
ride_paid	6233	100.00%	0.00%
ride_reviewed	4348	69.76%	30.24%

Key Findings

- The largest user drop-off occurs between Ride Accepted and Ride Completed.
- Approximately half of accepted rides are never completed.
- The overall funnel conversion equals 26.4%, indicating that approximately one out of four downloaded users completes a ride.

4. Drop-Off Analysis

Ride requests demonstrate clear demand peaks during:

- 8:00–9:00 AM
- 4:00–7:00 PM

During these periods:

- the number of ride requests increases significantly;
- unaccepted rides increase;
- driver shortages become more noticeable.

Longer waiting times are associated with higher cancellation rates and lower completion rates.

Ride Requests and Driver Availability by Hour

Ride Completion by Hour of Day

5. Platform Performance

The analysis shows that:

- iOS generates the highest number of users.
- iOS users create the largest number of ride requests.
- Web users represent the smallest user segment.

6. Age Group Analysis

Users aged 25–44 represent the most active customer segment.

The 35–44 age group generates the highest number of completed rides.

Users aged 18–24 and 45–54 demonstrate lower engagement and lower ride completion rates.

7. Key Business Findings

1. Major funnel loss occurs before ride completion. Although rides are accepted, many users never complete their trip.
2. Peak demand periods create service bottlenecks. Driver availability appears insufficient during morning and evening rush hours.
3. iOS users provide the strongest business value. This platform generates the largest volume of active users.
4. Users aged 25–44 show the highest engagement. This group should become the primary marketing audience.

8. Recommendations

- Simplify onboarding and registration.
- Encourage first ride completion through onboarding messages.
- Increase driver availability during peak demand hours.
- Improve driver allocation during morning and evening periods.
- Prioritize iOS acquisition campaigns.
- Focus advertising on users aged 25–44.

- Provide wait-time notifications.
- Offer incentives for first completed rides.
- Send reminders to users who abandon their first ride.

Conclusion

The Metrocar user funnel reveals substantial user losses before ride completion.

The largest opportunity for improvement lies in increasing ride completion rates by improving driver availability and reducing customer waiting times.

Implementing these recommendations may significantly improve conversion and customer retention.
